	(39)	3
	(40)	2
	(41)	1

4

Colonizing other worlds once seemed like science fiction. However, scientific advances and increased threats to humankind's survival are making it a near certainty.

First, tremendous progress has been made in developing the necessary technology. Innovations like reusable rockets will facilitate the transport of the people and materials necessary to support colonies on other planets. Scientific advances are also reducing costs, making colonization more practical.

Second, the combined threat of global warming, nuclear war, and disease outbreaks has the potential to wipe out humanity. As the fragility of human existence on Earth becomes clear, the will to devote resources to colonizing other planets is growing. Now, there is so much momentum behind it that the movement is certain to succeed.

Colonizing other planets is not without obstacles. However, technological development will allow humans to colonize other worlds in order to lessen threats to human survival.
