4	<p>A new technique called SRM could help tackle global warming by redirecting sunlight. Supporters think the technique could have a favorable economic impact on some countries with warmer climates. Yet there are concerns that dispersing chemicals may have some negative environmental side effects. Moreover, critics contend that SRM fails to deal with all of the various effects of CO₂ emissions, which are a root cause of global warming.</p>
5	<p>Although dangerous animals may be attractive as pets, there are too many risks. People should be banned from keeping dangerous animals as pets for reasons related to safety and animal welfare.</p> <p>First, such a ban is important for safety reasons. Even if owners take precautions, there will always be a risk that such animals may cause harm to their owners, neighbors, and even other animals. So, people should not be allowed to own such pets.</p> <p>Second, banning dangerous animals as pets improves animal welfare. Owners of such animals cannot let them roam freely, so they must be kept in enclosed spaces. However, this reduces the animals' quality of life, causing them to suffer when kept as pets.</p> <p>In conclusion, it is best to forbid dangerous animals from being kept as pets. Doing so is not only necessary from the perspective of safety but also safeguards the animals' well-being.</p>
