	(27)	2
	(28)	4
	(29)	3
	(30)	1
	(31)	2

4	District heating systems, in which multiple buildings share an energy source, are becoming more common globally. Supporters claim that because district heating is more energy-efficient, it helps diminish global warming. Furthermore, district heating systems undergo routine maintenance, resulting in less likelihood of failure. On the other hand, critics argue that installing district heating systems in areas with pre-existing buildings makes the process costly.
5	<p>As the global population swells, the question of whether governments should work together to increase global food production is important. I believe international cooperation is needed to address limited land space and to effectively create new technology.</p> <p>First, limited land space means governments must cooperate. To meet global demand, each country should focus on foods its land can produce efficiently. Through trade agreements, countries can be guaranteed enough of the foods they cannot produce themselves.</p> <p>Second, governments can support the development of new farming technology by working together. Scientists across the world all have their own specialized knowledge. Cooperative research projects can significantly increase food production worldwide.</p> <p>In conclusion, limited land space and the need for better technology show why governments should work together to improve global food production. Such cooperation can lead to a more food-secure world for everyone.</p>
